

Dogecoin

This was a project done by Anish Gurjar (a good friend of mine) and me.

Last year, Anish and I were really interested in cryptocurrencies and how celebrities like Elon Musk influence the prices of cryptocurrencies. We thus decided to make our final project for one of our CS classes on how different aspects of Twitter affect the prices of Dogecoin. Moreover, we even analyzed how Dogecoin prices were affected by the top 100 crypto influencers and how accurate they were in their predictions of prices.

We have used several different libraries, APIs, and external sources to gather our data. Additionally, we used some complex functions in order to produce as clear results as possible. In order to make it easier for the reader, we have even added graphs to understand the results better.
